A PROJECT REPORT

For

Project (MJPRU128)

Session (2025 - 26)

Submitted by

Vishal Gangwar

(240031280017)

Nitin Kumar

(240031280010)

Jitesh Kumar

(240031280008)

Submitted in partial fulfilment of the

Requirements for the Degree of

Bachelor of Computer Applications

Under the Supervision of

Miss. Hiba Siddiqui

Submitted to

DEPARTMENT OF COMPUTER APPLICATIONS

JPM PG COLLEGE BHAIRPURA

BAREILLY

CERTIFICATE

Certified that Vishal Gangwar (240031280017) , Nitin Kumar (240031280010), Jitesh Kumar (240031280008) have carried out the project work having “Zayka Dining” (Major Project) for Bechelor of Computer Application from M.J.P.

Rohilkhand University Bareilly. The project report embodies original work, and studies are carried out by the student himself/herself and the contents of the project report do not form the basic for the award of any other degree to the candidate or to anybody else form this or any other University/Institution.

This is to certify that the above statement made by the canditate is correct to the best of any knowledge.

Date:

Miss. Hiba Siddiqui

Assistent Professor

Department of Computer Applications

JPM PG COLLEGE BHIRPURA

Zayka Dining

ABSTRACT

In today's digital world, it is very important to manage restaurant operations, staff activities, customer orders, and daily transactions in a proper and organized way. Many restaurant owners face difficulty in managing tables, employees, reservations, billing, and food orders manually. To solve this problem, we have created a web application named "Zayka Dining".

This is a simple and user-friendly online system where restaurants can register and use the features based on their assigned roles. After registration, users can log in and perform the following tasks:

- Manage restaurant staff and assign roles
- Create and update menu categories and food items
- Handle table reservations and dining management
- Process customer orders and generate bills

The project is developed using Laravel version 12 along with Livewire Starter Kit, which helps us make dynamic web pages without writing too much JavaScript. The system also has features like secure login, registration, password reset, role-based access control, and personalized dashboards for Admin, Manager, Staff, and Users.

The main aim of this project is to help restaurants save time, reduce manual work, and keep operational records in a digital and secure format. This application is useful for restaurant owners who want to manage their staff, orders, menus, and customers in a proper way. With this application, all records stay well-managed and easily accessible from anywhere through a browser.

ACKNOWLEDGEMENT

First of all, we would like to express our heartfelt gratitude to the Almighty for giving us the strength, patience, and ability to complete this project successfully.

We sincerely thank our project guide **Miss. Hiba Siddiqui**, Department of Computer Applications, JPM P.G. College, Bhairpura, Bareilly, for his continuous guidance, valuable suggestions, and constant support throughout the development of our project "Zayka Dining Web App". His motivation and encouragement helped us learn many practical things beyond textbooks.

We would also like to thank the Principal, Head of Department, and all the faculty members of the Computer Applications Department for providing us the necessary infrastructure, academic support, and inspiration during the course of this project.

Our sincere thanks to our parents, family members, and friends whose moral support and encouragement helped us throughout the journey.

Last but not the least, we thank each other as team members —

Vishal Gangwar, Nitin Kumar, and Jitesh Kumar — for working with dedication, teamwork, and mutual cooperation in completing this major project with great effort and learning.

Vishal Gangwar

Nitin Kumar

Jitesh Kumar

Directory/File	Description
artisan	Laravel CLI entry point used for executing framework commands.
composer.json, package.json	Project dependencies and configuration for PHP and JavaScript packages.
app/Http/Controllers	Handles HTTP requests related to payments, invoices, and application routing logic.
app/Livewire	Livewire components and actions used for dynamic user interactions and authentication features.
app/Models	Eloquent models representing entities such as User, Restaurant, Booking, Table, MenuItem, Attendance, Blog, and OTP.
app/Services	Contains business logic services for booking management and invoice generation.
app/Mail	Handles email functionalities including OTP verification emails.
app/Notifications	Manages system notifications such as booking status updates.
app/Providers	Laravel service providers responsible for application bootstrapping and Fortify authentication configuration.
app/Concerns	Reusable traits for tenant management and validation rules.
database/migrations	Database table definitions and schema structure for restaurants, bookings, tables, attendances, permissions, and other modules.
database/seeders	Database seeders used to populate initial or sample data.
database/factories	Model factories used for testing and generating dummy records.
bootstrap/	Laravel bootstrap and application startup configuration files.
config/	Configuration files for authentication, database, mail, queues, permissions, services, and other application settings.
public/	Publicly accessible directory containing the application entry point (<code>index.php</code>), favicon, and other public assets.
resources/views	Blade templates for authentication pages, dashboards, layouts, restaurant pages, emails, and reusable UI components.
resources/css, resources/js	Frontend CSS and JavaScript resources compiled using Vite.
routes/web.php	Defines the main web routes for dashboards, bookings, restaurant features, and public pages.
routes/settings.php	Routes related to user profile, security, appearance, and account settings.
routes/console.php	Defines custom Artisan console commands for the application.
storage/	Stores logs, cached views, sessions, and uploaded application files.
tests/Feature, tests/Unit	Feature and unit tests covering authentication, bookings, attendance, dashboards, payments, and application functionality.
.github/workflows/	GitHub Actions workflows for automated testing, linting, and continuous integration processes.

Chapter 1: Introduction

1.1 Overview

In today's digital world, it is very important to manage restaurant operations, customer bookings, staff activities, and menu services in a proper and organized way. Many restaurant owners and managers face difficulties in maintaining reservations, employee records, menu management, and daily business activities manually. Manual processes are time-consuming, prone to errors, and do not provide efficient tracking and business insights.

To overcome this problem, we have developed a modern web-based application named **Zayka Dining**. This application helps restaurants manage table bookings, menu items, staff attendance, customer interactions, and restaurant operations — all through a single platform.

This system allows restaurants to register and use the platform based on role-based access control, including **Super Admin, Manager, Staff, and Customer roles**. It is especially helpful for restaurant and dining businesses that want to digitally streamline their operations, improve customer experience, and maintain records in a secure and organized manner.

1.2 Problem Statement

Many restaurant owners, managers, and small food businesses struggle to manage their daily operations properly. They often rely on manual registers, handwritten notes, or basic spreadsheets, which are not secure, not easily accessible from anywhere, and fail to provide efficient tracking of restaurant activities. Some common problems faced are:

- Lack of centralized and secure restaurant data
- Difficulty in managing table bookings and customer orders
- No proper system to handle menu items and pricing updates
- Manual errors in billing, attendance, and operational records

There is a strong need for a lightweight, easy-to-use system that removes these problems and provides a complete digital solution for restaurant management.

1.3 Objective of the Project

The main objectives of the **Zayka Dining** project are:

- To provide a digital platform for managing restaurant operations efficiently
- To simplify table booking and order management processes
- To enable proper staff and attendance tracking system
- To manage menu items, pricing, and availability in real time
- To reduce manual work and improve accuracy in restaurant operations
- To provide secure login, authentication, and role-based access control
- To make the system accessible anytime, anywhere through a browser

1.4 Scope of the Project

This system is useful for:

- Restaurant owners managing single or multiple outlets
- Managers handling daily restaurant operations and staff
- Staff members responsible for orders and table services
- Customers who want to browse menus and place bookings online

The system is built using **Laravel 12, Livewire Starter Kit, and modern UI components**, making it responsive, fast, and interactive. Since it is web-based, users can access the system from any device with an internet connection.

1.5 Key Features

Here are some important features offered by **Zayka Dining**:

- ✓ Role-based access (Super Admin, Manager, Staff, Customer)
- ✓ Secure authentication (login, register, password reset, OTP)
- ✓ Restaurant and menu management system
- ✓ Table booking and reservation management
- ✓ Order management with real-time updates
- ✓ Staff and attendance tracking
- ✓ Dashboard with analytics and reports
- ✓ Invoice and billing system
- ✓ Responsive design for mobile and desktop
- ✓ Built using Laravel 12 and Livewire for dynamic UI

Chapter 2: Literature Review

2.1 Existing System

In the existing manual system, most restaurant owners and staff manage their daily operations using registers, notebooks, or basic Excel sheets. They manually record customer bookings, staff details, menu updates, and billing information. This process is:

- Time-consuming
- Prone to human errors
- Difficult to update and maintain
- Lacks backup or online access
- Not scalable for growing restaurant businesses

Also, there is no centralized platform where all restaurant operations can be managed in one place. Most users rely on traditional methods, which often lead to mismanagement, delays, and confusion in handling day-to-day activities.

2.2 Drawbacks of the Existing System

- ✗ Risk of data loss due to physical registers or system crashes
- ✗ No real-time access or remote availability of restaurant data
- ✗ Difficulty in filtering and searching bookings or orders date-wise
- ✗ Manual errors in billing, attendance, and menu management
- ✗ No graphical reports or dashboards for business insights

2.3 Proposed System

To overcome these challenges, we have developed the **Zayka Dining** web application. It is a modern, user-friendly, and web-based solution for managing restaurant operations such as bookings, menus, staff, and customers in one integrated platform.

This system offers the following improvements:

- ✓ Centralized digital data storage for all restaurant operations
- ✓ Role-based access (Super Admin, Manager, Staff, Customer)
- ✓ Modules for Menu, Booking, Table, Attendance, and Order Management
- ✓ Real-time access from any device with internet connection
- ✓ Secure authentication with login and password protection
- ✓ Interactive dashboard with analytics and reports
- ✓ Easy to scale and upgrade in future
- ✓ Built using modern technologies (Laravel 12, Livewire, Tailwind UI)

2.4 Benefits of the Proposed System

Existing System	Proposed System (Zayka Dining)
Manual registers and Excel sheets	Fully digital web-based system
No security or backup	Secure authentication and protected data
Difficult to search records	Easy search and filtering options
No reporting system	Dashboard with charts and analytics
Limited local access	Accessible from anywhere via browser
Manual billing and tracking	Automated booking, billing, and order management

Chapter 3: Requirement Analysis

3.1 Introduction

Requirement analysis is one of the most important phases in software development. It defines what the system will do and how it will behave in different situations.

For **Zayka Dining**, the system is designed in such a way that restaurant owners, managers, staff, and customers can manage and access restaurant services like menu browsing, table booking, order management, and staff handling through a single platform. The system is role-based, so each user can access only their authorized features without confusion or data conflict.

3.2 Functional Requirements

Functional requirements define the core functions and features that the system must perform. These are the specific tasks that the software is designed to complete.

3.2.1 User Module

- Allow public registration for customers and restaurant users
- Secure login/logout functionality
- Forgot password and reset password feature
- OTP verification for secure access
- Personal dashboard after login
- Update profile and account settings

3.2.2 Restaurant Management Module

- Create and manage restaurant profile
- Update restaurant details and settings
- Handle restaurant status and configurations
- Manage branches (if applicable in future scope)

3.2.3 Menu Management Module

- Add new food items with name, price, and description
- Edit or delete menu items
- Organize items into categories
- Enable or disable item availability
- View complete menu list

3.2.4 Booking & Table Management Module

- Create and manage dining tables
- Allow customers to book tables online
- Edit or cancel bookings
- Assign table status (available/occupied/reserved)

3.2.5 Order Management Module

- Place orders for dine-in, takeaway, or delivery
- Update order status in real-time
- Generate invoices and billing
- View order history

3.2.6 Staff & Attendance Module

- Add and manage staff members
- Assign roles and responsibilities
- Mark daily attendance of staff
- View attendance history and reports
- Track working status

3.2.7 Expense & Report Module

- Add daily expenses with details
- Edit or delete expense records
- View total revenue and expenses
- Generate business reports
- Display dashboard analytics

3.3 Non-Functional Requirements

Non-functional requirements describe the quality attributes of the system. These do not define specific behavior but describe how the system performs tasks.

3.3.1 Performance

- The system should respond quickly to user actions
- Pages should load efficiently even under moderate traffic
- Optimized queries for fast database operations

3.3.2 Security

- All passwords must be securely hashed
- Role-based access control must be implemented
- CSRF protection and route middleware security enabled
- Sensitive restaurant data must be isolated per tenant

3.3.3 Scalability

- The system should support multiple restaurants (SaaS model)
- It should handle increasing users and data without performance issues
- Can be deployed on shared or cloud-based hosting

3.3.4 Usability

- Clean and modern responsive UI for all devices
- Easy navigation for all user roles
- Proper validation and error messages in forms
- User-friendly dashboard with clear insights

Chapter 4: Hardware and Software Requirements

4.1 Introduction

Before developing or running any web application, it is important to define the hardware and software environment where the system will be developed, tested, and deployed.

For the **Zayka Dining** web application, a standard development environment is required that supports **Laravel 12, Livewire, and modern web browsers**. Since it is a web-based SaaS system, it can run on both local and cloud servers efficiently.

4.2 Hardware Requirements

Component	Minimum Requirement	Recommended Requirement
Processor	Intel Core i3 or equivalent	Intel Core i5 or higher
RAM	4 GB	8 GB or higher
Storage	10 GB free disk space	SSD with 20 GB or more
Display	1024x768 resolution	Full HD (1920x1080)
Internet	Basic broadband connection	Stable high-speed internet
Device	Laptop/Desktop	Laptop/Desktop with external monitor support

4.3 Software Requirements

Software	Version / Description
Operating System	Windows 10 / Ubuntu 20.04 or above
Web Server	Apache 2.4 / Nginx
PHP	PHP 8.2 or higher
Composer	Latest stable version (dependency manager)
Laravel Framework	Version 12.x
Livewire	For frontend interactivity
Database	MySQL 8.0 / MariaDB
Node.js & NPM	Node.js 18+ with npm
Code Editor	VS Code / Sublime Text / PHPStorm
Browser	Chrome / Firefox / Edge (latest versions)
Postman (Optional)	For API testing
Git	For version control

4.4 Environment Setup (Basic Stack)

The following stack is used to run the application in development:

- XAMPP / Laravel Sail / Laravel Valet (for running PHP server and MySQL)
- VS Code for writing and managing code
- Terminal / Git Bash for running Artisan and npm commands
- Web browser for testing UI and application features

This setup ensures smooth development, testing, and deployment of the **Zayka Dining** system across different environments.

Chapter 5: System Design and Architecture

5.1 System Flow Diagram

System flow diagram describes how a user interacts with the system from start to finish. It shows the logical flow of operations such as registration, login, dashboard access, and restaurant management activities.

User Flow Explanation:.

- ◆ Register/Login: Users create an account or sign in securely
- ◆ Dashboard: Displays restaurant stats, bookings, and quick actions
- ◆ Manage Menu: Add, edit, and delete food items and categories
- ◆ Manage Tables: Create and organize dining tables
- ◆ Manage Bookings: Handle customer reservations and updates
- ◆ Manage Staff & Orders: Manage employees and customer orders

5.2 ER Diagram (Entity Relationship Diagram)

This diagram shows the database structure and how different tables (entities) are related in the system.

Entities:

- Users
- Restaurants
- Menu Items
- Tables
- Bookings
- Orders
- Attendances
- Expenses

Relationships:

- One User can own one or multiple Restaurants (SaaS model)
- One Restaurant has many Menu Items
- One Restaurant has many Tables
- One Restaurant receives many Bookings
- One Restaurant processes many Orders
- One Restaurant manages multiple Staff Attendances
- One Restaurant records multiple Expenses

5.3 Database Design (Table Structure)

Chapter 6: Tools and Technologies Used

6.1 Introduction

This project, **Zayka Dining**, is developed using modern web technologies that provide speed, flexibility, security, and scalability. These tools help in building a dynamic, responsive, and easy-to-maintain SaaS-based restaurant management system.

In this chapter, we discuss the technologies and tools used in both frontend and backend development, along with supporting environments.

6.2 Frontend Technologies

Technology	Purpose
Blade Templating (Laravel)	Used for building dynamic HTML views using Laravel's templating engine
Tailwind CSS	Utility-first CSS framework for fast and responsive UI design
Livewire	Creates dynamic UI components without writing heavy JavaScript
Flex UI Components	Pre-built UI components for consistent layout and design
HTML5 & CSS3	Basic structure and styling of web pages
JavaScript (Minimal)	Used for small client-side interactions and enhancements

6.3 Backend Technologies

Technology	Purpose
Laravel 12	Main PHP framework used for MVC architecture, routing, authentication, and business logic
PHP 8.2	Server-side scripting language required to run Laravel
MySQL	Relational database used to store restaurant, user, booking, and order data
Composer	Dependency manager for PHP packages
Artisan CLI	Command-line tool for migrations, seeders, and system commands

6.4 Supporting Tools and Platforms

Tool / Platform	Use Case
Visual Studio Code	Code editor for developing Laravel project
XAMPP / Laravel Valet	Local development environment with PHP, MySQL, and Apache
Git	Version control system for tracking project changes
GitHub	Online platform for code hosting and collaboration
Postman (Optional)	API testing and request handling
Google Chrome	Primary browser for testing UI and functionality
Canva / MS Word	Used for creating reports, diagrams, and documentation

6.5 Why These Technologies Were Chosen

- ♦ Laravel 12 provides a secure, structured, and scalable MVC framework
- ♦ Livewire enables dynamic UI without complex JavaScript
- ♦ Tailwind CSS and Flex UI ensure a modern, responsive, and clean interface
- ♦ MySQL offers reliable and efficient relational data storage
- ♦ Blade and Artisan tools simplify backend development and maintenance

These technologies together make **Zayka Dining** a scalable, secure, and user-friendly restaurant management system capable of handling real-world SaaS requirements efficiently.

Chapter 7: Implementation / Module Description

7.1 Introduction

The implementation phase is the actual construction of the system using selected tools and technologies. In this chapter, we explain how each major module of Zayka Dining was developed and what functionality it performs.

The application is divided into different modules to make the system modular, scalable, and easy to maintain in a SaaS environment.

7.2 Module Descriptions

◆ 1. User Authentication Module

Description:

This module handles user registration, login, password reset, OTP verification, and profile management for all system users including customers and restaurant staff.

Features:

- Register any user (no admin needed)
- Secure login with session management
- Forgot Password & Reset functionality
- Email verification on signup
- Update profile and password
- Logout option

Implementation Tools:

Laravel Fortify, Livewire, Blade components, OTP Mail system

◆ 2. Dashboard Module

Description:

The dashboard provides a summary view of restaurant activities such as bookings, menu items, orders, staff activity, and revenue insights.

Features:

- Card-based summary of key restaurant data
- Welcome message with user/restaurant name
- Quick navigation to modules
- Analytics and basic chart visualization
- Role-based dashboard view (Admin/Manager/Staff/Customer)

Implementation Tools:

Livewire components + Tailwind UI cards + Chart components

◆ 3. Restaurant & Menu Management Module

Description:

This module allows restaurant owners/managers to manage restaurant details and food menu items.

Features:

- Add and update restaurant profile
- Create food categories
- Add new menu items with price and description
- Enable/disable menu availability
- View complete menu list

Implementation Tools:

Livewire components (MenuItem CRUD), Blade forms, Eloquent models

◆ 4. Table & Booking Management Module

Description:

This module manages restaurant tables and customer reservations.

Features:

- Create and manage dining tables
- Online table booking by customers
- Update booking status (pending/confirmed/cancelled)
- Assign bookings to tables
- View booking history

Implementation Tools:

Livewire (BookingCreate, BookingList), relationships with Table model

◆ 5. Order Management Module

Description:

This module handles customer orders for dine-in, takeaway, and delivery.

Features:

- Create new customer orders
- Add menu items to order
- Update order status in real-time
- Generate invoice and billing
- Track order history

Implementation Tools:

Livewire components, InvoiceService, StripeController (for payments)

◆ 6. Staff & Attendance Module

Description:

This module manages restaurant staff and tracks their daily attendance.

Features:

- Add and manage staff members
- Assign roles and permissions
- Mark daily attendance
- View attendance reports
- Track staff activity

Implementation Tools:

Attendance Model, Livewire components, Spatie Permission package

◆ 7. Expense & Financial Module

Description:

This module is used to track restaurant expenses and financial records.

Features:

- Add daily expenses with details
- Edit or delete expense entries
- View total expenses
- Financial summary in dashboard
- Filter expenses by date

Implementation Tools:

Expense models (custom implementation), Livewire forms, Blade tables

◆ 8. Settings & Profile Module

Description:

This module allows users to manage their account settings and security preferences.

Features:

- Update profile details
- Change password
- Manage security settings
- Delete account with confirmation
- Role-based settings access

Implementation Tools:

Livewire settings pages, Laravel Fortify, Blade forms

Chapter 8: Testing

8.1 Manual Testing Approach

In this project, we followed a manual testing approach to ensure that each module of the system works correctly according to the requirements. Manual testing involves testing the application by interacting with all features and verifying whether they behave as expected.

We divided the entire system into modules such as User, Menu, Booking, Orders, Staff, Attendance, and Expenses, and tested them one by one. We also verified that form validations, error messages, successful operations, and UI responsiveness were working properly.

The testing was done on:

- Google Chrome (Desktop Browser)
- Mobile browser (Responsive view)
- Localhost server (Laravel Valet/XAMPP)

We ensured the following:

- Each form accepts only valid input
- Proper error messages are shown for invalid entries
- Data is stored correctly in the database
- Pages load correctly without errors
- Layout adjusts on small and large screens

Manual testing gave us confidence that the system is **reliable, user-friendly, and production-ready**.

8.2 Sample Test Cases

Test Case ID	Module	Test Description	Expected Result	Status
TC-01	User Login	Login with valid credentials	User should redirect to dashboard	Pass
TC-02	Registration	Create new account with valid data	Account should be created successfully	Pass
TC-03	Forgot Password	Enter registered email for reset	Reset link should be sent to email	Pass
TC-04	Menu Management	Add new menu item	Item should appear in menu list	Pass
TC-05	Table Booking	Book a table with valid details	Booking should be created successfully	Pass
TC-06	Order Management	Place order with menu items	Order should be saved successfully	Pass
TC-07	Staff Management	Add new staff member	Staff should be added successfully	Pass
TC-08	Attendance	Mark attendance for staff	Attendance should be recorded	Pass
TC-09	Expense Management	Add expense entry	Expense should be saved successfully	Pass

✓ All above cases were tested manually by team members and passed successfully.

Chapter 9: Screenshots

9.1 Introduction

Screenshots provide visual proof of working functionalities of the system. They help teachers, evaluators, and readers understand how the system looks and operates in real-time. Below are important screens from the **WorkTrack Web App** along with short descriptions.

9.2 List of Screenshots

1. Home Page (Welcome Screen)

📸 Screenshot 1.1: Welcome Page

This is the homepage shown to the user before login. It includes the application name, a short tagline, and navigation links to login/register.

2. Password Forget-Page

📸 Screenshot 1.2: Password Forget Form

Users can reset their forgotten password by submitting their registered email through the password forget form.

3. User Registration Page

 Screenshot 1.3: Registration Form

The registration form is titled "Create an account" and is for the email "testt@gmail.com". It features a "Full Name" field with the value "Vishal Gangwar". Below this, there are two radio button options: "Customer" (selected) and "Restaurant Owner". The "Customer" option includes the text "Book tables and pay online", while the "Restaurant Owner" option includes "Manage my restaurant profile, tables, and staff". A "Complete Registration" button is at the bottom.

Create an account

Complete registration for testt@gmail.com

Full Name

Vishal Gangwar

I want to register as a

Customer ☒
Book tables and pay online

Restaurant Owner ☐
Manage my restaurant profile, tables, and staff

Complete Registration

Users can create a new account by registering with their name, email, and password using the registration form.

3. Login Page

 Screenshot 1.3: Login Form

The login form is titled "Log in to Zayka Dining" and prompts the user to "Enter your email below to receive a 6-digit verification code". It features an "Email address" field with the value "you@example.com". A "Send OTP Code" button is at the bottom.

Log in to Zayka Dining

Enter your email below to receive a 6-digit verification code

Email address

you@example.com

Send OTP Code

Users can log in using their registered email and OTP to access their dashboard.

4. Dashboard (User Panel)

 Screenshot 1.4: User Dashboard

This screen shows a quick summary of users, booking, restaurant, and payment. Users can navigate to any module from here.

5. Admin Dashboard

 Screenshot 1.5: Admin Home Page

This form allows the admin to manage users and payment actions.

6. Restaurant Dashboard

 Screenshot 1.6: Restaurant home page

The screenshot shows the 'Restaurant Console' interface for 'Zayka Dining'. The left sidebar contains navigation links: 'Bistro Console', 'Bistro Dashboard', 'Reservations', 'Royal Menu', 'Culinary Blogs', 'Floor Tables', 'Staff Roster', and 'Attendance Logs'. The main content area is titled 'Restaurant Console' and includes a sub-header 'Manage Vishal Gangwar profile, seating tables, staff roster, and reservation approvals'. A top navigation bar shows the user is a 'MANAGER'. The dashboard features four summary cards: 'Monthly Revenue' (₹0.00), 'Dining Tables' (5), 'Staff Roster' (0), and 'Pending Approvals' (0). Below these are tabs for 'Reservations & Staff', 'Royal Menu', and 'Culinary Blogs'. The 'Reservations Console' section shows a table with columns: Customer, Details, Payments, Status, and Actions. It currently displays 'No bookings found.' The 'Staff Attendance Logs' section shows a table with columns: Staff Member, Check-In, Check-Out, and Duration. It currently displays 'No shifts recorded.' On the right, the 'Restaurant Details' section includes input fields for Name (Vishal Gangwar), Email (contact@spicesymphony.in), Phone (4567894561), and Address (Baheri), with a 'Save Profile' button at the bottom.

All the users and table added by the user are listed here with options to edit or delete.

7. Payment Page **

 Screenshot 1.7: Payment home page

The screenshot shows the 'Payment' page. At the top, it displays 'STRIPE Test Mode' and 'Request ID: #1'. Below this, a summary box shows 'Restaurant: Vishal Gangwar' and 'Manager: Sun Resto (contact@spicesymphony.in)'. The 'Total Due' is ₹4,999.00. The payment form includes fields for 'Cardholder Name' (Sun Resto), 'Card Number' (4242 4242 4242 4242), 'Expiration Date' (12/29), and 'CVC' (123). A large orange button at the bottom says 'Pay ₹4,999.00'.

This screen is used to send payment.

8. Staff Dashboard

 Screenshot 1.8: Staff home page

Users can mark live or absent for each worker by selecting the site and date.

10. Profile Settings Page

 Screenshot 2.0: Profile Update Page

Users can update their personal details like name, email, and password from this section.

Chapter 10: Conclusion and Future Scope

10.1 Conclusion

The **Zayka Dining** system was successfully developed and implemented as a comprehensive restaurant management platform designed to simplify restaurant operations and improve overall efficiency. The project aimed to reduce manual work, enhance customer experience, and provide a centralized solution for managing restaurant activities digitally.

By using modern web technologies such as **Laravel 12, Livewire, Tailwind CSS, and MySQL**, we were able to build a system that is secure, responsive, scalable, and easy to use. The application provides role-based dashboards for **Super Admin, Manager, Staff, and Customers**, allowing each user to access features relevant to their responsibilities.

The core modules of the system — **User Authentication, Restaurant Management, Menu Management, Table Booking, Order Processing, Staff Attendance, Billing, and Payment Management** — were developed, tested, and found to function correctly.

This project enhanced our understanding of **web application development, SaaS architecture, role-based access control, MVC architecture, and component-based development** using **Laravel and Livewire**.

10.2 Limitations

While the system works well in its current form, there are some limitations which can be improved in future versions:

- **Basic Reporting Features**
The system provides essential operational data but lacks advanced business intelligence and analytical reports.
- **Single Language Support**
The application is currently available only in English, which may limit accessibility for users from different linguistic backgrounds.
- **No Dedicated Mobile Application**
The system is accessible through mobile browsers but does not provide a native mobile application experience.

10.3 Future Enhancements

In future versions of the project, the following enhancements can be implemented to improve the overall functionality and user experience:

- **Advanced Analytics and Reports**
Introduce detailed sales reports, customer insights, and revenue analytics with interactive charts.
- **Multi-language Support**
Add support for Hindi and other regional languages to improve accessibility for diverse users.
- **Mobile Application Development**
Develop dedicated Android and iOS applications using Flutter or React Native.
- **Enhanced Notification System**
Implement email, SMS, or push notifications for booking confirmations, order updates, and promotional offers.
- **Online Food Delivery Integration**
Extend the system to support complete food delivery workflows and delivery partner management.
- **Cloud Backup and Data Recovery**
Provide automated cloud backup and restoration mechanisms to ensure data safety and business continuity.

Chapter 11: References

The project titled "**Zayka Dining**" was developed using open-source tools and technologies. Throughout the development process, we referred to official documentation, community resources, and GitHub repositories for understanding and implementing **Laravel**, **Livewire**, **authentication mechanisms**, **payment integration**, and **role-based access control**.

Official Documentation

- **Laravel Official Documentation**
 <https://laravel.com/docs>
- **Livewire Documentation**
 <https://livewire.laravel.com>
- **Laravel Breeze Documentation**
 <https://github.com/laravel/breeze>
- **Spatie Laravel Permission Documentation**
 <https://spatie.be/docs/laravel-permission>
- **Stripe Documentation**
 <https://docs.stripe.com>
- **Mailtrap Documentation**
 <https://mailtrap.io/docs/>

Main Resources Used

- **GitHub Repositories** – Various Laravel 12 and Livewire-based open-source projects were explored to understand project structure, SaaS implementation patterns, and best development practices.
- **Stack Overflow** – Used for community support and resolving Laravel- and Livewire-related development issues.
- **Laravel Community Resources** – Articles, tutorials, and discussions were referred to for implementing advanced features and optimizing application performance.
- **Mailtrap** – Used as the email testing service for implementing and testing the OTP verification system during development.

Tools and Development Environment

- **Visual Studio Code** – Main code editor used for development.
- **XAMPP / Laragon** – Local development environment with PHP, MySQL, and Apache support.
- **Git & GitHub** – Used for version control, project backup, and collaboration.
- **Laravel Artisan CLI** – Used for creating migrations, models, controllers, seeders, and executing framework commands.
- **Google Chrome / Brave Browser** – Used for testing application functionality and responsiveness.
- **Composer & NPM** – Used for managing PHP and JavaScript dependencies.
- **Mailtrap** – Used for testing email delivery and OTP verification functionality in the development environment.

Project Contributors and Guide
